

Alkaline Pitcher Maintenance

New Assembly

Pitcher: Use a cleaning solution made of 5 mL (1 tsp) unscented chlorine bleach to 1 L (4 cups) of water. An alternate cleaning solution is 5 mL (1 tsp) of white vinegar in 1 L (4 cups) of water. Wash all plastic parts in cleaning solution. Rinse thoroughly with clean water. Do not use cleaning solution for the Alkaline Pitcher Filter. Do not scrub the plastic with coarse material like scrub wool or steel wool.

Filter: Rinse the new Alkaline Pitcher Filter under cold running tap water until water coming from the bottom of the filter runs clear; this should take about 3-5 minutes. Shake the filter periodically as you run it under tap water to ensure the loose carbon is flushed out (placing a white dish in the sink will make it easier to see when the water running out of the filter is clear). Dry the outside of the Alkaline Pitcher Filter with a clean paper towel. Insert the Filter into the upper tank (reservoir) of the Alkaline Pitcher and press firmly along the rim of the filter, making sure that the silicon ring at the widest part of the filter sits evenly in place. If the silicone ring sticks out, remove the filter and adjust the silicone ring. Then, insert the filter again. Note that if it is easy to pull the filter out of the upper tank (reservoir), it has not been fully inserted.

Removing the filter:

Take the upper tank (reservoir) with the filter out of the pitcher.

Turn the upper tank upside down and gently push down on the bottom of the filter until it is dislodged.

60-Day Timer: Set the 60-day timer by pressing the START button firmly until the clock blinks three times (this takes about 5 seconds) and then release the button. The timer display should read “60 days.” Every 24 hours the clock will count down by one. When the timer reaches “0 days” it is time to replace the filter, and reset the clock.

After 60 days

Pitcher: Drain and disassemble the Alkaline Pitcher.

Removing the filter:

Take the upper tank (reservoir) with the filter out of the pitcher.

Turn the upper tank upside down and gently push down on the bottom of the filter until it is dislodged.

Use a cleaning solution made of 5 mL (1 tsp) unscented chlorine bleach to 1 L (4 cups) of water. An alternate cleaning solution is 5 ml (1 tsp) of white vinegar in 1 L (4 cups) of water. Wash all plastic parts in cleaning solution. Do not use cleaning solution for the Alkaline Pitcher Filter.

Using a clean cloth, paper towel or 2 pieces of unscented facial tissue, wipe clean the inside of the pitcher to remove carbon dust that may have settled over time. Also wipe clean the bottom of the pitcher especially along the silicone foot.

Rinse all plastic parts thoroughly. **Caution:** Do not wet the 60-day timer on the lid.

Do not scrub the plastic with coarse material like scrub wool or steel wool.

Filter: Replace.

60-Day Timer Reset: When a new filter is inserted, reset the clock following a two-step process: 1) Press the START button firmly until the clock blinks three times (this takes about 5 seconds) and then release the button. The timer display should go blank. 2) Press the START button until the clock blinks three times (this takes about 5 seconds) and then release the button. The timer display should read “60 days.”
